mDSR + FDP: Mechanized Rice Row Seeder with Deep Fertilizer Placement

Sow and fertilize rice in one pass.

International Rice Research Institute

CGIAR

International Rice Research Institute (IRRI)

Nguyen Van Hung

Mechanized Direct Seeding with Fertilizer Deep Placement (mDSR-FDP) sows rice in rows and places fertilizer near the root zone in one mechanized operation. It supports public priorities for rice mechanization, efficient input use, farm competitiveness and low-emission production, although emission reductions also require appropriate water and straw management.

This technology is pre-validated.

8·7 Scaling readiness: idea maturity 8/9; level of use7/9

Climate impact 7

Problem

- **Low productivity:** Uneven establishment limits yields.
- **High costs:** Excessive inputs weaken farmer incomes.
- **Input waste:** Poor application reduces resource efficiency.
- **Mechanization gaps:** Smallholders lack timely services.
- **Environmental pressure:** Inefficient input use increases losses and emissions.

Solution

- **Raise yields:** Pilot increases reached 2.6–15.8%.
- **Lower costs:** Total input costs fell by 18–36%.
- **Improve incomes:** Net profits increased by 26–79%.
- **Save inputs:** Seed fell by 30–65% and fertilizer by 11–43%.
- **Expand access:** Deliver equipment through shared services.

Key points to design your project

Mechanized Rice Row Seeder with Deep Fertilizer Placement (mDSR + FDP) supports government priorities by improving rice establishment, input efficiency, mechanization, and farmer profitability. Public support is most justified where smallholders need shared access, training, field infrastructure, and reliable machinery services.

- Prioritize rice-producing areas with suitable fields, water control, tractor access, and enough demand to keep machines in use.
- Deliver the technology through cooperatives and custom-hire providers, supported by training, field levelling, maintenance, spare parts, and affordable finance.
- Track hectares served, input use, yield, costs, income, machine utilization, emissions, service prices, and timely access for women and resource-poor farmers.
- Scale only after confirming local performance, commercial viability, operator capacity, maintenance support, and benefits across multiple seasons.
