

# Golden cassava: Vitamin A fortified cassava varieties

Yellow-fleshed cassava rich in vitamin A

Yellow-fleshed cassava is a vitamin A-enriched variety. The variety is the result of the cross-breeding of natural lines containing high levels of provitamin A and hybrid lines with higher yield potential disease resistance and drought tolerance.

Inclusion assessment 4

Climate impact 5

### Problem

- Lack of essential nutrients in conventional cassava varieties, notably vitamin A deficiency affecting 50% of children.
- Insufficient vitamin A leading to preventable blindness and weakened immune systems in children.
- Limited nutritional value and agronomic challenges, such as disease susceptibility and low yield potential.

### Solution

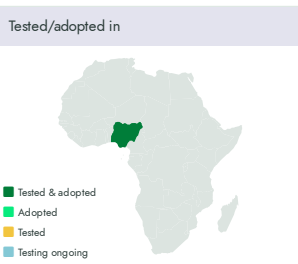

- Golden cassava varieties are enriched with provitamin A, addressing vitamin A deficiency and hidden hunger.
- Through breeding, golden cassava exhibits enhanced traits like disease resistance and drought tolerance.
- These varieties contain 2 to 3 times more provitamin A, meeting nutritional needs in cassava-dependent communities.
- Golden cassava suits various agro-ecosystems, enhancing its reach.

## Key points to design your program

Golden cassava varieties are vitamin A-enriched, yellow-fleshed cassava developed to address malnutrition while increasing yields. With high productivity, disease resistance, and drought tolerance, they are ideal for regions facing climate challenges.

- Aligned with SDG 2, SDG 3, and SDG 13, they enhance food security, promote better health, and support climate-resilient farming.
- Part of the Cassava Technology Toolkit, they complement innovations like mechanized planting to maximize farmer productivity.
- Already introduced in seven African countries through the ENSURE project, golden cassava is driving improved nutrition, sustainable farming, and increased farmer incomes with support from IITA.
